EDUCATION

University of Georgia

Bachelor of Science in Computer Science | Certification in Artificial Intelligence

Athens, GA

Expected Graduation: December 2026

Coursework: Computing Architecture, Data Structures, Algorithms, Computing Architecture, Systems Programming, Software Development, Database Management, Web Programming, Artificial Intelligence, Discrete Mathematics, Linear Algebra, Data Science I.

PROFESSIONAL EXPERIENCE

Bell Flight (Textron) | Data Engineering Intern

May 2026 - Aug 2026

- Migrated Bell Flight's AssetDB from SQL Server to Databricks by restructuring raw-layer ingestion pipelines; Implementing a medallion architecture (drop-zone→raw→enriched→curated) via Databricks Asset Bundles, and building a validation framework with SMTP alerting across 9+ file formats blocking malformed data from entering raw layer.
- Built an AI triage agent for Passport access requests that reads live request data from a REST API, emails follow-up questions to requesters via email, and auto-generates a summary, reducing approver bottlenecks by 35% caused by vague requests.
- Rebuilt Microsoft's retired Master Data Services as an in-house React solution with Excel-like CRUD features, enabling data entry for business users and publishing validated changes directly into the Databricks pipeline.

UGA Agricultural Robotics Lab | Undergraduate Researcher

August 2025 - May 2026

- Developed and evaluated autonomous navigation functionality for a poultry-farm rover, focusing on sensor-driven movement logic and on-device computation to support controlled indoor testing environments.
- Implemented and tested autonomous navigation algorithms on Raspberry Pi using Python, integrating motor-control scripts with ultrasonic sensor feedback to detect obstacles, tune turning behavior, and reduce navigation errors by ~30% across 20+ indoor trial runs.

Trinity Health | IT Infrastructure Intern

May 2025 - August 2025

- Reimaged and deployed 150+ computers using Darik's Boot and Nuke, auditing IT assets across departments and reducing device-related downtime for 200+ staff
- Configured and maintained 30+ network devices (access points, switches), cutting network-related service tickets by 25%.

FWE | Front-End Engineering Intern

January 2025 - May 2025

- Developed and customized responsive web interfaces using React and Node.js, applying user-centered design principles, improving cross-platform usability and performance.
- Conducted layout audits and implemented UX heuristics that reduced user drop-off rates by 20% on key pages; optimized site architecture and navigation through iterative design cycles, A/B testing, and performance analytics review.

SolutionZ Inc. | Information Technology Intern

August 2022 - February 2023

- Collaborated with 4 interns to allocate \$50,000+ in grants to 20+ Georgia schools, expanding technology access; optimized network security and AV systems in 15+ conference rooms to boost data protection and collaboration.
- Gained hands-on experience in network troubleshooting, software deployment, and AV technology integration within corporate environments, improving operational efficiency and supporting seamless day-to-day business functions.

PERSONAL PROJECTS

SeatScout

January 2026 - Present

- Built a full-stack ticket aggregation platform using **Next.js** and **React**, integrating 4 major ticketing APIs (Ticketmaster, StubHub, SeatGeek, Vivid Seats) to deliver real-time price comparison across NBA, NFL, MLB, and NHL inventories, saving users an average of \$47 per ticket and comparing 250,000+ tickets since launch.
- Engineered end-to-end architecture spanning frontend UI, backend API layer, and Clerk authentication, implemented dynamic section-level pricing logic to surface cheapest listing across all platforms into a single unified interface, supporting 100+ users.

StockScope

August 2025 - January 2026

- Built a full-stack, cross-platform stock research app using **React Native** (Expo) and **Node.js/Express**, delivering real-time market data, personalized watchlists, and secure authentication across iOS and Web for 1,000+ stock symbols; designed 10+ REST API endpoints integrating FintHub and NewsAPI with Node-Cache caching to cut external API requests by ~40% and reduce latency.
- Developed a modular frontend architecture with **React Navigation** and **Firebase** (Auth + Firestore), enabling persistent user profiles and watchlists for 100+ saved assets per user while maintaining clean separation of concerns for scalability.

LectureAI

Jan 2025 - December 2025

- Built LectureAI, a **Next.js** 14 + **TypeScript** app converting lecture recordings and YouTube videos into AI study notes, summaries, and key term definitions; achieved 95%+ transcription accuracy, cut note-taking effort by 60%+, and processes 60-minute lectures in under 10 minutes across 100+ students and multiple file formats (MP3, WAV, MP4, YouTube).
- Engineered a **Supabase**-powered dashboard with AI-generated quizzes, progress tracking, and a mobile-first **Tailwind CSS** + **React** UI; deployed on Vercel with GitHub auto-updates, scaling to 500+ lecture uploads with <5% error rate.

TECHNICAL SKILLS

- **Programming Languages:** Java, Python, C, JavaScript, TypeScript, SQL
- **Frameworks/Libraries:** React, [Next.js](#), Tailwind CSS, [Express.js](#), Firebase SDK
- **Dev Tools:** Databricks, Azure, Docker, Clerk, Node.js, Git, GitHub, Postman, Maven, VS Code, Linux, Vercel
- **Certifications:** CCSMM Cybersecurity Program Development; Google Foundations of Cybersecurity; Databricks Fundamentals; Databricks AI Agent Fundamentals
